

FAQ Answers

Version Control: – Enable instructors to update course content while maintaining access to previous versions.

This means that each course content has a flag indicating if it's out dated or not.

If that content is outdated, students shouldn't be able to see it, but instructors can.

Interactive Modules •

Quizzes and Assessments: – Adaptive quizzes dynamically adjust question difficulty based on user performance.

This means that each module has a difficulty level.

Each student based on his performance metric can see certain modules. For example, we can have ranges for the performance of students and if a student is in the range of an average student then he can only see the easy and medium modules. Student has to level up in terms of performance by retaking quizzes to be able to access the hard modules.

Same applies for quizzes, quizzes are generated based on a student performance so again if a student is average based on his performance metric then the generated personalized quiz for him will only include easy and medium questions.

Keep in mind that instructors initiate the generation of the quizzes indicating how many questions it will include and which types of questions will it include (MCQs, True or false).

• Real-Time Feedback: – Instant feedback on quizzes, highlighting correct answers and areas for improvement.

Since questions have answers we compare the student answer with the answer attached in DB and give him instant feedback once he finishes the quiz.
